Team Agreements

This agreement is aimed at creating a work method where each team member knows the production requirements These may vary over time according to the production development: There may be stages where the workload will be higher for the conceptual directors, and in other stages, the tech and programming team will have to kick it with more time investment than in the early stages.

This agreement aims to establish a working relationship and timeframe where each of you knows your time requirement for individual work, as well as for group meetings and decision making.

- ***Goal*** : What is the purpose of the team which unifies you?

To create a sailing game, and an interesting installation to interface with it for the showcase. Using projection and custom controls.

- ***Decision Making*** : Does everyone have to agree before making any change to the project? What happens in case of a disagreement? Is there a director who is in charge of the overall vision, and therefore gets to make the final decision based on the input of each member?

During the prototyping process, in the interest of quick iteration there won't be much limitation on making changes, outside big disagreements in vision. In this case Noah will make the final decision.

- ***Collaboration tools:*** How do you share files? What platform do you find most efficient and flexible for everyone to share and synchronize with others?

Github.

- ***Meetings per week***: (This should be updated as the project develops)

Please Specify How many meetings per week besides class time, and on which platform (In person \ Zoom\ Other).

One meeting per week, in person, about 1 hour at this point.

- ***Participation expectations:*** An estimation of the Scope of work in hours per week, expected from each group member. This will undergo changes as the project develops.

Aim for about 5 hours per week for members of the team, while collaborators are flexible.

Roles and Responsibilities (Who is doing what):

- ***Installation design and Concepts:***

Who is directing the experience, and if it is a shared thinking, how are decisions being made? Whose responsibility is it to update the Design values document along the production process?

Noah is directing the experience and will update the design values document.

- ***Programming: Noah***

- ***Art Direction : Noah***

- ***Sound Design: Noah/Sam***

- ***Art Implementation: Animation \ Video\ live action,or any other source material manufacturing:***

  Please specify responsibilities according to your installation components. You should relate to modeling\ rigging and animation as separate tasks, and specify who does what. The same goes for live footage shooting which requires a photographer, and an editor. All the roles involved in the making of your Installation's core material should be broken down to their creation process stages, and specified.

  Fabrication of custom controllers will be completed with collaboration. This involves a wheel with a motor, and a pulley system with a motor, both for sensing and resistance.

- ***Direction of Prototyping and Testing***: This responsibility may change and shift according to the prototype's nature: Naturally, tech and core design prototypes should be managed by the programmers, while art or other playtests could be directed by the art and concept team members.

  Noah will work on tech prototyping. Art prototyping will be tackled later with collaboration.

Design Values Document:

- ***Short description of your installation:*** Describe in brief the core characteristics of your installation: Idea, Spatial design, Number of simultaneous participants, and primary techniques involved (AR|VR|PROJECTION| OTHER).

The overall idea is a sailing game, but it would be really cool to present it in a special format for the showcase, with wall projections and custom immersive controls.

In its most developed form, the installation would consist of three projections onto 3 walls with several "controllers" placed inside the room. The main control would be a helmsman's wheel or tiller in the back/center, and there could also be a basic pulley system set up for raising/lowering the mast or adjusting lines.

There would probably only be two or three participants interacting with the controllers at a time, but in an ideal scenario the room would be big enough for observers. But there could even be a camera tracking people's placement in the room for some sort of "lean" factor–for example, shifting people to one side of the room could make the boat heel over.

- ***Experience:*** What do the participants get to do when experiencing your installation? How does it make them feel physically or emotionally?

On a basic level, the participants' interactions will affect and control the boat's movement. But I hope that with intuitive enough onboarding, they will be able to use their interactions to make progress along a journey, and experience story beats along the way. I hope to give them the feeling of controlling the elements and overcoming setbacks to achieve a goal.

- ***Theme***: What is the Installation about? How does it represent this to the participants? What concepts, Perspectives, or experiences might the participants encounter during the experience? How are these delivered? (Through a story/Image/metaphor?).

The installation is about a journey, and about trying (and sometimes failing) to control the elements. Participants will encounter these themes through different

weather conditions/environments, all playing into the story of a setback + perseverance.

- ***Point of view***: What does the participant see, hear, or feel? From what cultural reference point?

The participant will be surrounded by elements of nature–waves, wind, etc. I think the cultural reference point could be thought of in a general way as foreign.

- ***Artistic Style***: How is the information within it represented? Is it very realistically detailed? How is the style correlated to your concept and storytelling approach? We relate to Concept Art as part of the director's nonverbal statement about the installation's theme. It's a storytelling tool that conveys a message through artistic style, editing style, and movement. If you already envisioned an artistic style for your work, check it and tweak it according to these criteria.

A slightly cartoonish art style balanced with good scene/shot composition would be ideal. I think it will correlate well with the fantastical/exaggerated elements of the environment (giant waves, etc) and the casual gameplay/storytelling.

So it's not intended to be visually realistic, but I hope to still give it the feeling of realism through movement and sound design. Particularly for the showcase display, I'd like to lean into immersion to take advantage of the custom controls and projections.

- ***Challenges and constraints:*** What are the participants encouraged to do? How do you make them active —emotionally or physically?

The participants are encouraged to help sail the boat. I think this goal would drive them into interesting communication scenarios. If the group center of mass ~ boat center of gravity could work, that would be a really interesting communication problem, and would get everyone involved. Though it might distract from the story elements I want to highlight.

- ***Context***: Where is the installation placed? Does it depend on a specific physical environment? Who is your audience—could they be passersby, or does it ideally belong in a gallery? (For art-oriented public?)

It doesn't depend on a specific physical environment. I think the audience could be passersby, as long as the controls are intuitive enough and the goal is well communicated.

- ***Emotion:*** How would you like your participants to feel after experiencing your installation? What are they left with?

I'd like them to feel a bit of the leftover disorientation/thrill of the immersion, but also a sense of calm. I'd really like to balance the emotional impact of the story and the "feeling" of the controls. So ideally afterward they would be left with a mix of those two things.
